With the native **ProCall for Mac OS X**, small and medium-sized companies can profit from the tried-and-tested features of the Unified Communications best-seller ProCall Enterprise and improve their cooperation.
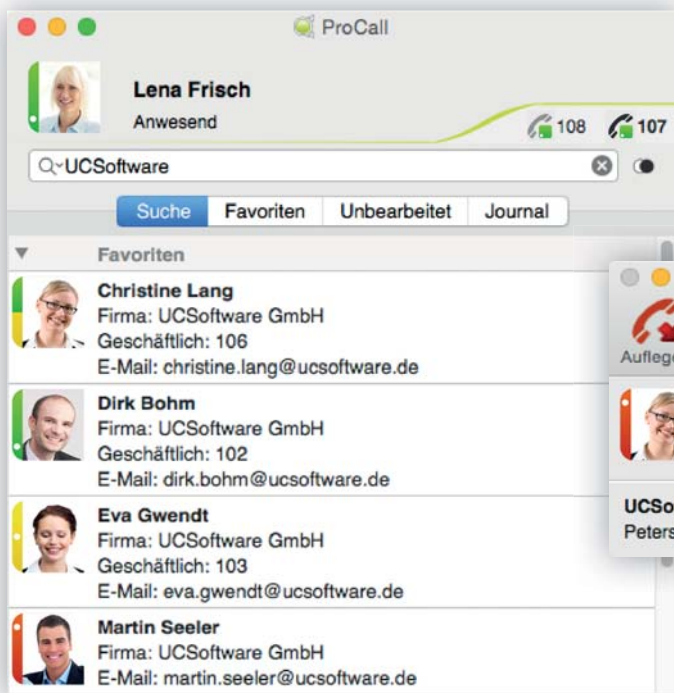

ProCall Enterprise

Native Client for Mac OS X

Communicate and Collaborate Better.

The client supports the following Apple operating systems:

Mac OS X 10.6.8 „Snow Leopard", Mac OS X 10.7 „Lion"

OS X 10.8 „Mountain Lion", OS X 10.9 „Mavericks"

OS X 10.10 „Yosemite", OS X „El Capitan"

The native client for Mac OS X from ProCall Enterprise includes functions such as hotkey dialing, reverse search and a call log, instant messaging (chat) and presence management for Mac workstations in the company.

Support for multiple telephone lines means that extensions (desk phone, DECT) can be integrated. The control of call forwarding or call barring is also available with just a click.

Active and missed calls are archived in the personal (call) log. There are various filters available (day, week, month and caller), which means that calls can be tracked and processed conveniently.

Internal and external contacts are organized in Favorites. Federation allows the secure exchange of presence information and instant messages (chat), including beyond the company's four walls.

The application is optimized for Microsoft Outlook:mac 2011, including the local Mac OS X address book and other data sources such as CRM, ERP or goods management systems.

LDAP contacts or the Microsoft Active Directory can be linked via the MetaDirectory. This allows efficient searching in all contact data sources directly from ProCall for Mac OS X.

ProCall Enterprise clients with existing licenses are also optionally able to use these for ProCall for Mac OS X.
